

Green & Circular Economy for SMEs

Green and circular economy approaches support business growth while reducing environmental impact. By improving resource efficiency and reducing waste, SMEs can create long-term value and strengthen competitiveness.

Linear Economy - Traditional Model

Resources are extracted, used to produce goods, and then discarded. This model leads to resource depletion, waste generation and increasing costs over time.

Circular Economy - Sustainable Model

Reduce - Reuse - Recycle

Resources are kept in use for as long as possible. Products, materials and components are reused, repaired or recycled to minimise waste and maximise value.

SMEs represent over 90% of businesses worldwide. Their transition to sustainable practices has a significant impact on the economy and the environment.

Green Economy

Growth within environmental limits.

1. Efficient use of resources
2. Reduced environmental impact
3. Sustainable production and consumption

Sustainability Pillars

Balanced development requires:

Environmental

Protect Natural Resources.

Social

Support people & communities.

Economic

Ensure long-term viability

All three pillars are interconnected.

What this means for SMEs

Adopting green and circular practices helps businesses:

- Reduce costs and resource use
- Lower environmental and regulatory risks
- Improve efficiency and operations
- Strengthen long-term competitiveness
